MATERIAL FLOW ANALYSIS
A LOOK AT THE NUMBERS GLOBALLY AND IN ASIA

The latest IAI Material Flow Model update highlights the increase of production rates, recyclability and usage of scrap sources over the past 70 years (1950-2021). It shows a particularly sharp rise in all areas over the past 20 years globally and even more so in Asia. In 2021, Asia (excluding China and Japan) has a per capita consumption of aluminium in final products of 6kg, compared to China (19kg), Japan (22kg) and globally (11kg). This indicates a huge possible future growth potential for the region.

PRIMARY ELECTROLYTIC PRODUCTION

This chart shows the progress of global primary production. There was a steady rise in the 20th century – from around 1.5 million tonnes in 1950 to 24.7 million tonnes in 2000. This is an increase of 23.2 million tonnes in 50 years.

Since the turn of the century, global primary electrolytic production has risen sharply, up from 24.7 million in 2000 to 68.5 million in 2022 – an increase of 43.8 million tonnes in 22 years.

IAI currently publishes five different scenarios on Alucycle. All forecasting data used in this article is based on the 2022 IAI Reference Scenario.

Visit international-aluminium.org for more information.
RECYCLED PRODUCTION

This chart shows the amount of recycled ingots globally has more than doubled in less than 15 years. In 2007, the figure was 17.6 million tonnes, rising to 37.0 million tonnes in 2021.

Progress is expected to be steep. It is estimated that the amount of recycled ingots globally will more than double again in another 20 years – to 67.7 million tonnes in 2041.

SCRAP SOURCES

This chart shows the increase in old and new scrap availability globally since 1950 – with the quantity of available old scrap exceeding new scrap for the first time in 1990 and remaining at a higher level ever since.

Old scrap is generated after a product has been in productive use and has been discarded by its end-user. New scrap is generated between semis fabricated products (i.e. aluminium sheet) and final products (i.e. aluminium can).

By 2036, the availability of old scrap sources is expected to be double that of new scrap sources for the first time – 44.6 million tonnes vs 22.1 million tonnes. And by 2050, there are expected to be 38.9 million more tonnes of old scrap sources (66.2 million tonnes) globally than new scrap sources (27.3 million tonnes).
**PRODUCTION IN ASIA**

Data shows that production increases in Other Asia are greater than globally.

143%

Between 2011 and 2021, primary electrolytic production in Other Asia* increased by 143%. Globally, the increase over the same period was 45%.

*The production in Other Asia includes data from India, Indonesia, Malaysia, Pakistan, Singapore, South Korea, Taiwan, Thailand and Vietnam.

**ALUMINUM PRODUCTION IN OTHER ASIA**

Metallurgical alumina production in Asia has experienced a linear increase up to 2015. The past decade has seen the most significant leap, with production doubling between 2015 and 2021.

**Leading producers of alumina, 2022**

- **China**: 58% (75.8M tonnes)
- **Other Asia**: 8% (19.7M tonnes)
- **Oceania**: 15% (10.6M tonnes)
- **Other Producers**: 4%
- **North America**: 1%
- **Middle East**: 3%
- **South America**: 8%
- **Europe**: 3%
- **Japan**: 0%
- **2022**: 8M tonnes
- **2021**: 4.5M tonnes
- **2020**: 3.3M tonnes
- **2019**: 2.9M tonnes

Of the four leading producing regions (in bold above), Other Asia had the second largest growth between 2021 and 2022 (+0.8 million tonnes). China’s growth was 4.4 million tonnes, and South America and Oceania’s production in 2022 was lower than in 2021.
BAUXITE PRODUCTION IN OTHER ASIA

The leading producer of bauxite in 2021 is Oceania, which produced 92.7 million tonnes – more than a quarter of the global share.

Other Producers - predominantly Africa (81.0 million tonnes) - and China (80.8 million) were the second and third largest producers respectfully, with around one quarter of the share. Asia is fourth with 46.0 million tonnes produced.

2021 OTHER ASIA TRADE BALANCE

Other Asia’s total aluminium imports (11.6 million tonnes) and exports (11.1 million tonnes) are almost in balance in 2021. Bauxite (3.4 million tonnes aluminium content) and aluminium (1.7 million tonnes) are net exported, while alumina (0.3 million tonnes aluminium content), semis (0.4 million tonnes), final products (1.3 million tonnes aluminium content) and scrap (3.5 million tonnes) are net imported.

This is unique to Asia as all other regions are either significant exporter or importer regions.
